P1)  $w_1 = 4, w_2 = 2, w_3 = 2, b = -5$   
 $x_1 = \text{weather}, x_2 = \text{company}, x_3 = \text{Proximity}$   
 Activation =  $S = 4x_1 + 2x_2 + 2x_3 - 5$   
 $O.P = 1$  if  $S > 0$ .

| $x_1$ | $x_2$ | $x_3$ | $S = -5$ | $y$ | Result |
|-------|-------|-------|----------|-----|--------|
| 0     | 0     | 0     | -5       | 0   | x      |
| 0     | 0     | 1     | -3       | 0   | x      |
| 0     | 1     | 0     | -3       | 0   | x      |
| 0     | 1     | 1     | -1       | 0   | x      |
| 1     | 0     | 0     | -1       | 0   | x      |
| 1     | 0     | 1     | 1        | 1   | ✓ Go   |
| 1     | 1     | 0     | 1        | 1   | ✓ Go   |
| 1     | 1     | 1     | 3        | 1   | ✓ Go   |

→ (1, 0, 1), (1, 1, 0), (1, 1, 1).

P2] Inputs =  $x_1$  &  $x_2$  weights =  $w_1 = 1, w_2 = 2$   
 Bias,  $b = -1.5$ .

→  $S = w_1 x_1 + w_2 x_2 + b = x_1 + 2x_2 - 1.5$   
 $y = 1$  if  $S > 0$ .

→ Decision boundary Equation.

$x_1 + 2x_2 - 1.5 = 0 \Rightarrow x_2 = \frac{1.5 - x_1}{2}$

| $x_1$ | $x_2$ | $b = -1.5$ | $y$ |
|-------|-------|------------|-----|
| 0     | 0     | -1.5       | 0   |
| 0     | 1     | 0.5        | 1   |
| 1     | 0     | -0.5       | 0   |
| 1     | 1     | 1.5        | 1   |

### Q3] Logic Gate Emulation.

$w_1 = w_2 = -2$        $b = 3$  in NAND Gate

NAND = NOT + AND Gate

$$S = w_1 x_1 + w_2 x_2 + b = -2x_1 - 2x_2 + 3$$

$y = 1$  if  $S > 0$ , else 0

→ Truth table.

| $x_1$ | $x_2$ | $S = -2x_1 - 2x_2 + 3$ | $y$ |
|-------|-------|------------------------|-----|
| 0     | 0     | 3                      | 1   |
| 0     | 1     | 1                      | 1   |
| 1     | 0     | 1                      | 1   |
| 1     | 1     | -1                     | 0   |

→ Other gates are: AND Gate, NOT Gate, OR Gate.

Pu] Non-linearly separable Patterns  
XOR - function

→ XOR Truth Table.

| $x_1$ | $x_2$ | $y$ |
|-------|-------|-----|
| 0     | 0     | 0   |
| 0     | 1     | 1   |
| 1     | 0     | 1   |
| 1     | 1     | 0   |

$y=1$  when inputs are different

$$y = \begin{cases} 1 & \text{if } \sum w_i x_i + b > 0 \\ 0 & \text{otherwise} \end{cases}$$

→ XOR is non-linearly separable - The 1's & 0's can't be separated by single straight line in 2D.

We need multi-layer perceptron to implement XOR.

$$w_1 x_1 + w_2 x_2 + b$$

→ i)  $w_2 + b > 0$  ii)  $w_1 + b < 0$  iii)  $b \leq 0$

iv)  $w_1 + w_2 + b \leq 0$

$$w_1 + b > 0 \Rightarrow b > -w_1, \quad w_2 + b > 0 \Rightarrow b > -w_2$$

$$b \leq 0$$

$$(w_1 + b) + (w_2 + b) \leq -b$$

LHS '+'

RHS '-'

Contradiction.

NO solution.
